PolyMem® = Multifunctional Wound Healing

CLEANSES:
- 
- The built-in moisturizer (glycerin) helps maintain and establish a moist microenvironment.

MOISTENS:
- 
- Powerfully absorbing agents selectively wick away a proportionally higher part of the watery portion of fluid from the wound.

FILLS:
- PolyMem dressings are available in ideal configurations for cavities, tunnels and undermining.
- 
- The colorless dressing eliminates naturally forming cavities, tunnels or undermining, ensuring a closed microenvironment.

MOISTURIZES:
- Partial open abdominal surgical wound managed with moist gauze dressing. Patient was not referred to surgery.

ABSORBS:
- Due to its high affinity to water molecules, the built-in superabsorbents are particularly effective in absorbing watery portions of fluids and keeping the dressing dry.

CLEFTS:
- PolyMem dressings are available in ideal configurations for cavities, tunnels and undermining.

Facility-Based Evaluations:

- Healing under adverse conditions (cradling with Charcoal dressing for odor control).
- PolyMem is standard of care for donor sites at some facilities.
- PolyMem reduced the need for additional cleansing during dressing changes.
- PolyMem is standard of care for donor sites at some facilities.
- PolyMem dressings are available in ideal configurations for cavities, tunnels and undermining.
- PolyMem dressings are available in ideal configurations for cavities, tunnels and undermining.
